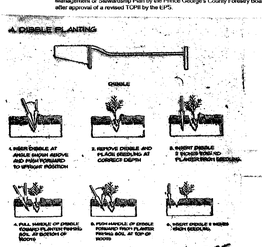
Type II Tree Conservation Plan Notes
For an Off-site Woodland Conservation Mitigation Bank

1. This plan does not propose the disturbance of any existing woodlands and therefore is not required to identify or provide any Woodland Conservation to address the on-site requirements. The sole purpose of this Tree Conservation Plan is to establish off-site mitigation areas to satisfy the woodland conservation requirements for other properties. Any future activities on this property that result in the clearing of any woodland will initiate the Woodland Conservation requirements for this property. At that time the TCPII shall be revised to calculate the requirements for this property and demonstrate how those requirements are being satisfied in addition to the off-site mitigation areas already created.
2. Cutting or clearing of woodland not in conformance with this Plan or without the expressed written consent of the Planning Director or designee shall be subject to a $1.50 per square foot mitigation fee, 1:1 replacement of the disturbed woodlands and other requirements that may be required due to the ½ : 1, 2 to or 1:1 replacement requirements associated with the clearing of woodlands.
3. Per CB-60-2005, the seller of any property is required to inform the purchaser at the time of contract signature that the property is subject to a Tree Conservation Plan and provide a copy of the Type II Tree Conservation Plan that depicts the area subject to the Tree Conservation Plan.
4. Off-site woodland conservation mitigation areas created for the purpose of satisfying the off-site woodland conservation requirement of a benefiting property may not be used to satisfy the requirements for this property in the future.
5. All off-site woodland conservation mitigation on this property shall be encumbered by a declaration of covenants recorded in the Land Records of Prince George's County, Maryland and/or other protection documents as found acceptable by the M-NCPPC Environmental Planning Section (EPS). The Declaration of Covenants shall encumber only the portion of the property included in the off-site mitigation bank, and be described by a metes and bounds description.
6. Prior to the recordation of any declaration of covenants encumbering any portion of this property, a draft of the document shall be submitted to the Environmental Planning Section, MNCPPC for appropriate review and approval.
7. Off-site woodland conservation mitigation banks may not encumber lands previously protected or encumbered by permanent protection instruments.
8. Each subsequent commitment for a portion of the mitigation bank will require the submittal of a signed sales agreement and draft Transfer Certificate to the Environmental Planning Section for review prior to recordation. Each Transfer Certificate shall clearly cross-reference the appropriate TCPIIs and project names (banking property and benefiting property).
9. All off-site woodland conservation areas established on existing (preserved) woodlands shall be credited at a rate of 2 acres of existing woodlands for every 1 acre of off-site woodland conservation mitigation required, in accordance with NR Article 5-1607(b)(2).
10. Off-site woodland conservation areas established as afforestation areas or natural regeneration shall be credited at a rate of 1 acre of afforestation for every 1 acre of off-site mitigation required, but may not be transferred until after two growing seasons and certification of adequate survival unless an afforestation bond is posted.
11. The TCPII Off-site Woodland Conservation Summary Table shall be revised each time a Transfer Certificate is recorded to identify the acreages affected, the benefiting property name and TCPII number, and the recordation numbers.
12. If a Transfer Certificate is recorded and is later found to be unnecessary, a written request shall be submitted to the EPS to evaluate the Transfer Certificate release request. If it is determined that the Transfer Certificate may be released, the EPS will notify the applicant that a release document may be submitted for processing.
13. The purchase or sale of off-site woodland conservation mitigation credits involves the transfer of real property rights and may be subject to Maryland property transfer tax at the time of recordation of a Transfer Certificate.
14. Timber harvesting activities on the site may occur only after approval of a Forest Management or Stewardship Plan by the Prince George's County Forestry Board and after approval of a revised TCPII by the EPS.

A. DIBBLE PLANTING



Woodland Conservation Worksheet
for
Prince George's County

Zone:	OS		
Gross Tract:	170.62		
Floodplain:	9.69		
Previously Dedicated Land:	0.00		
Net Tract (NTA):	160.93	0.00	0.00

*Include acreage in the corresponding columns for each zone.

Property Description or Subdivision Name:	Cross Road Trail -Parcel 67- TCP II/25/06
Is this site subject to the 1989 Ordinance?	N
Reforesation Requirement Reduction Questions:	
Is this one (1) single family lot? (y,n)	N
Are there prior TCP approvals which include a combinationof this lot and/or other lots. (y,n)	N
Is this a Mitigation Bank	Y
Break-even Point (preservation) =	0.00 acres
Clearing permitted w/o reforestation=	0.00 acres

Woodland Conservation Calculations:		Net Tract (acres)	Floodplain (acres)	Off-site Impacts (acres)
Existing Woodland		99.54	9.69	
Woodland Conservation Threshold (NTA) =	0.00%	0.00		
Smaller of a or b		0.00		
Woodland above WCT		99.54		
Woodland cleared		0.00	0.00	0.00
Smaller of d or e		0.00		
Clearing above WCT (0.25 : 1) replacement requirement		0.00		
Clearing below WCT (2:1 replacement requirement)		0.00		
Afforestation Threshold (AFT) =	0.00%	0.00		
Off-site Mitigation being provided on this property		147.12		
Woodland Conservation Required		**0.00**		

Woodland Conservation Provided:	(acres)	
Woodland Preservation	0.00	
Afforestation / Reforestation	0.00	
Area approved for fee-in-lieu	0.00	$0.00
Credits for Off-site Mitigation on another property	0.00	
Off-site Mitigation being provided on this property	147.12	
Total Woodland Conservation Provided	**147.12**	

Area of woodland not cleared 99.54 acres
Woodland retained not part of requirements 99.54 acres

95.33 acres of preservation mitigation available @ 2:1 for off-site mitigation purposes
50.84 acres of afforestation mitigation available @ 1:1 for off-site mitigation purposes
0.95 acres of natural regeneration available @ 1:1 for off-site mitigation purposes

PLANTING STANDARDS:

1. All plant material shall meet the minimum requirements of size and grade to the latest edition of American Standard for Nursery Stock, ANSI Z60.1. A copy of the standards can be obtained at www.anla.org/applications/anlastore/store/viewproduct.aspx?id=484896.
2. Four corners informal comply with the latest edition of "Specifications Plant Measure" as adopted by the American Joint Committee of Horticultural Nomenclature. Plants of variation and hand locations generally with centers accepted by nurseryman trade. All plants shall be true to name and tagged legibly as to name in accordance with nursery methods of practice as recommended by the American Nursery and Landscape Association.
3. All plants shall be nursery grown in a similar climatic zone to this project.
4. Pre-called branching plants from tightly graded nursery rows will be rejected.
5. All plants shall be free of injurious insects, insect eggs, larvae, and all forms of infestation, plant diseases, mildew or dead roots, or damage to trunk, bark, branches, leaves or root systems, or sun-burnt. All plants shall be free of dodder, dodgeriging bark, extensive injuries, and frost cracks. All plants to be free of scale or damage by bark and bole.
6. Planting of bare root stock may not occur only in the spring up to and including April 30th.
7. Planting will be conducted under acceptable conditions, such as when temperatures are below 32° F. or above 40° F.

SITE PREPARATION:

Undesirable Competing Vegetation(herbicide and/or mech): Undesirable competing vegetation includes herbaceous plants, vines, shrubs or trees that are not native to the region or plants that will adversely affect the growth of the native plants to be planting area. Invasive and/or exotic species that are found in the vicinity of this site include Japanese Stilt Grass, Japanese Honeysuckle, Japanese Barberry, Tree of Heaven, Mile-a-Minute vine, Garlic Mustard and Kill Deer (Poison Ivy). Control of these species within the afforestation area is imperative to the ultimate success of this project and therefore must be planted and the objective is for the substantial non-presence to appear natural. All vegetation control of invasive and/or exotic species shall be accomplished by a combination of mechanical and/or chemical control.

The most practical mechanical control for this site is the use of a brush hog or bogs mowers to cut the undesirable vegetation to ground level. This method is non-selective and will also remove many desirable plants and trees that may be growing within the area where the control measures are being applied.

Chemical control of vegetation implies that the chemicals to be applied in accordance with the label instructions for the application, methods being used and for the species of vegetation being controlled. All applications of a chemical (herbicide) shall be done by individuals licensed within the jurisdiction in which the work is to be done or under the direct supervision of a licensed individual.

1. Herbicide treatment of the planting areas, prior to prepared spring planting, the herbicide application shall be done in the fall.
2. The spraying shall treat strips between 18 and 24 inches wide with a herbicide that is labeled for the ground cover, which is located and an application shall be done in accordance with the label instructions.
3. The vegetation between the spray strips may be mowed or brush-hogged periodically, 2x/year May and October, until the trees reach a size such that equipment can no longer fit between the trees without damaging the trees.

Destination Meds of this site was placed in agricultural production for hay production following the completion of the surface mining in the 1960s and does not require additional fertilization.

Control of Undesirable Competing Vegetation with Mulching: Placement of mulch around newly planted and established trees minimizes competing vegetation, wind compaction and moisture fluctuations. Mulch may be placed around the tree ranging for a radius of nine (9) inches and to a depth of 2 to 3 inches. Mulch should not be placed against the trunk will likely cause pest and disease problems and increase tree stress. Mulch with composted and aged (composted for 6 months minimum) and contains the 2 to 3 inch depth and keep most down unmowed. Mulch should be free of weed seeds, free of pests and free of pathogens. The mulch should be free of any toxins or chemicals. The site will be evaluated after the first and second growing seasons to determine if additional vegetation control is required. If determined to be necessary, mechanical and/or chemical control will be done to ensure that competing vegetation is adequately suppressed to ensure the required survival rate of 75 percent.

HANDLING SEEDLINGS:

1. Seedlings will arrive as bare root stock. The trees shall be imported to meet good root to top ratio and to ensure that the planting material is moist and intact.
2. Bare root seedlings may remain in temporary storage in a cool dark damp location for no more than 1 week after planting.
3. Container grown seedlings shall be stored in an area where irrigation is available and checked daily to ensure that the seedlings are moist.
4. If planting of bare root stock cannot be completed within 1 week of delivery, the seedlings shall be heeled in (planted in bundles) at a temporary location, until ready for planting, in a manner that will not damage the root system or the seedlings. The planting will commence when the ground is thawed and conditions are favorable for planting. The heeling in will cease for finishing project by or beyond no 3 weeks beyond which go risk is likely to have begun bud expansion of the dormant root system or to become a problem.

PLANTING SEEDLINGS (BARE ROOT):

1. Bare root seedlings shall be planted in an area free of competing vegetation for a radius of no less than 2 to 12 inches.
2. Planting may be done with a mattock, planting bar, dibble planter or by digging a hole.
3. Seedling shall be placed in the hole meaning the root system is not folded or bent or curled in such a way that it was in the nursery bed.
4. The roots shall not be damaged in a circular fashion or twisted upwards from the bottom of the planting hole.
5. Backfilling of the roots is not desirable and should be avoided because improper tamping down during the backfilling process can cause air pockets and could affect the survival of the seedling. Improper tamping down of the soil around the seedling can extremely long roots.
6. The hole shall then be closed by tamping the soil in the hole, with sole or heel and then by watering.
7. Heeling seedlings while planting is necessary important because of their size and the need with which it takes to plant the seedlings, and to keep the root system moist during the planting process.
8. Temporary Heel: The planting hole has been completed and the seedling is ready to go into the ground. Remove one or two roots of the seedling to the side of the hole and place the seedling in the hole so that the root collar is at or just below the surface of the soil.
9. Watering the area after planting is not necessary for seedlings that are bare root planting stock. Holds a 12 inches radius area around the plant to hold water and keep competing vegetation during the first growing season. Quickening is optional if conditions are favorable.

TREE CARE:

1. Bare root seedlings in the first two years to the survival of damaged and hazardous branches only. Maintenance pruning of the trees should be done during the dormant season. Pruning should be done to remove dead, diseased, rubbed or problematic or undesirable branches only. All pruning should follow the International Society of Arboriculture pruning standards for all pruning.
2. The use of tree paints is prohibited.
3. The use of tree stakes is prohibited.

Watering:

1. Tree seedlings shall be watered with 1 gallon of water if planted in excessive stock. Seedlings planted in bare root stock do not need watering.
2. Soils shall be checked prior to watering to ensure that supplemental watering is required. Do not water if soil is saturated.

TREE SURVIVAL:

1. The planting area shall have a minimum survival rate of 75 percent. If the survival rate falls below 75 percent during the first two years it will be necessary to do a reinforcement planting with similar species to maintain the planting area so as to fill any gaps that may be present.

SEQUENCE OF WORK:

1. Control undesirable competing vegetation (herbicide/mechanical)
2. Order plants based on Planting Schedule (September)
3. Prepare site planting area (Spring/Fall)
4. Receive trees and other plant materials (March or April)
5. Plant trees and other plants in accordance with and planting can be completed, within 1 week of arrival
6. Trees not planned within 1 week of arrival must be stored in mulch beds that cover the roots and prevent drying out
7. Maintain the seedlings in accordance with the standards of this plan (April)
8. Conduct first inspection and report to owner (July and October)

APPROXIMATION/REFORESTATION MANAGEMENT PLAN

Year 1:
- Site preparation (control undesirable competing vegetation)
- Planting of trees and other plants in accordance with the plan (Fall)
- Control checks – minimum 75% (November 2006)

Year 2:
- Control undesirable competing vegetation (herbicide or mechanical) (August 2006)
- Check for insect, disease and pest infestation and report as needed (July and October 2006)

Year 3:
- Reinforcement planting if needed to ensure 75% survival rate (April 2008)
- Control of undesirable competing vegetation (herbicide or mechanical)
- Check for insect, disease and pest infestation (August 2007)

Year 4:
- Reinforcement planting only if needed to ensure 75% survival rate (April 2008)
- Control check only if planting done prior to June 2008 (September 2008)

Planting Schedule for Upland Areas
Total afforestation – 51.79 ac.

Loblolly Pine	Pinus taeda	Seedlings	850/acre	44,022
Black Locust	Robinia pseudo.	Seedlings	100/acre	5,179
Flowering Dogwood	Cornus florida	Seedlings	50/acre	2,590

Site preparation for the planting area shall consist of mowing or bush hogging along with spot herbicide treatment as necessary.

I hereby acknowledge that I have been advised of the restrictions established by this Tree Conservation Plan. I further acknowledge that cutting, clearing, or damaging trees or understory vegetation in the Woodland Conservation Area without a revision to this plan or written authorization from the M-NCPPC Environmental Planning Section or the Department of Environmental Resources will constitute a violation of the Woodland Conservation Ordinance. Hazardous trees may be pruned or removed after obtaining a written report from a Licensed Arborist or Licensed Tree Expert and providing a copy to the M-NCPPC Environmental Planning Section.
